Docket No.: 10014266-1

Title: SYSTEM FOR ERROR CORRECTION CODING AND DECODING

---

**IN THE CLAIMS**

Please cancel claims 11-12 and 14.

Please amend claims 1-4, 8, 10, 13, 15, 23, and 26 as follows:

1. (Currently Amended) An error correction system for error correction coding and decoding at least one information block, comprising:
  - first and second encoders each configured to encode the at least one information block, ~~wherein the second encoder has a higher capability than the first encoder and~~
    - wherein the first encoder generates first parity symbols during encoding of the at least one information block, and
    - wherein the second encoder generates second parity symbols during encoding of the at least one information block, with a ~~quantity~~number of the second parity symbols being greater than a ~~quantity~~number of the first parity symbols; and
  - first and second decoders configured to recover the at least one information block,
    - wherein the first decoder and the second decoder are configured to operate sequentially in time with the first decoder acting first and the second decoder acting second,
    - wherein the first decoder is configured to recover the at least one information block using the first parity symbols ~~generated when the first encoder encodes the information, and provide an indication if the information cannot be recovered~~, and
    - wherein the second decoder is configured to recover the at least one information block encoded by the second encoder via the second parity symbols with the second decoder configured to remain inactive during operation of the first decoder and further remain inactive after operation of the first decoder unless only if the first decoder is unsuccessful in attempting to cannot recover the at least one information block and until the first decoder provides an indication to the second decoder to recover the at least one information block ~~with the second decoder configured to recover the information using the second parity symbols generated when the second encoder encodes the information.~~

Docket No.: 10014266-1

Title: SYSTEM FOR ERROR CORRECTION CODING AND DECODING

---

2. (Currently Amended) The system of claim 1, wherein the at least one information block is encoded to produce a codeword by combining the information, the first parity symbols, and the second parity symbols.

3. (Currently Amended) The system of claim 2, comprising:  
a multiplexer configured to combine the at least one information block, the first parity symbols and the second parity symbols into the codeword.

4. (Currently Amended) The system of claim ~~1~~<sub>3</sub>, wherein the at least one information block is encoded by combining the at least one information block, the first parity symbols, and the second parity symbols generated when the second encoder encodes both the at least one information block and the first parity symbols.

5-7. (Canceled)

<sup>5</sup>  
~~8~~ (Currently Amended) The system of claim 4, wherein the second decoder is configured to recover the at least one information block by using second parity symbols generated when the second encoder encodes both the at least one information block and the first parity symbols.

9. (Canceled)

<sup>6</sup>  
~~10~~ (Currently Amended) The system of claim 1, wherein the second decoder comprises:  
a register configured to store the at least one information block and the second parity symbols; and  
a processor system configured to recover the at least one information block by using second parity symbols only if the first decoder provides the indication.

11-12. (Canceled)

Title: SYSTEM FOR ERROR CORRECTION CODING AND DECODING

<sup>7</sup>  
~~13~~. (Currently Amended) A storage system having an error correction system for ~~error~~  
~~correction~~ coding and decoding at least one information block, comprising:  
    a first encoder and second encoders each configured to encode the at least one  
information block, wherein the first encoder using applies first parity symbols;  
    a and the second encoder configured to encode the at least one information block by  
applyingies second parity symbols which are greater in number than the first parity symbols  
to enable locating and correcting a larger number of errors than the first encoder; and  
    a first decoder and second decoders configured to recover the at least one information  
block, wherein the first decoder acts first to recover the information; and  
    the second decoder configured acts second to recover the at least one information  
block sequentially in time after operation of the first decoder, wherein encoded by the second  
encoder the second decoder initiates action to recover the at least information block only after  
completion by if the first decoder of an unsuccessful attempt cannot to recover the at least  
one information block, and further wherein the first and second encoders and the first and  
second decoders use an error correcting code;  
    wherein the first decoder and the second decoder are configured to recover the at least  
one information block via separating the at least one information block from the first parity  
symbols and the second parity symbols, respectively.

14. (Canceled)

<sup>8</sup>  
SM ~~15~~. (Currently Amended) The system of claim <sup>7</sup>~~14~~, wherein the first and second encoders  
and the first and second decoders the linear block code is use a cyclic redundancy check code.

16. (Cancelled)

<sup>9</sup>  
~~17~~. (Original) The system of claim <sup>7</sup>~~15~~, wherein the first and second encoders and the first  
and second decoders use a burst-correcting code.

18-22. (Canceled)

Docket No.: 10014266-1

Title: SYSTEM FOR ERROR CORRECTION CODING AND DECODING

---

<sup>10</sup>  
~~23~~. (Currently Amended) A method of error correction coding and decoding information, comprising:

generating a number of first parity symbols from the information;

generating a number of second parity symbols from the information, wherein the number of the second parity symbols is greater than the number of the first parity symbols;

combining the first parity symbols, the second parity symbols and the information into an encoded data block;

recovering the information from the encoded data block, if no errors are present in the encoded data block, via disassembling the encoded data block by removing both the first parity symbols and the second parity symbols from the information;

recovering the information from the encoded data block, if an error is present in the encoded data block, by first using the first parity symbols if the information ~~can~~ is capable of being~~be~~ recovered using the first parity symbols; and

recovering the information from the encoded data block, after using the first parity symbols, by second using the second parity symbols only if recovery of the information was not accomplished ~~cannot be recovered by~~ using the first parity symbols.

<sup>11</sup>  
<sup>10</sup>  
~~24~~. (Original) The method of claim ~~23~~, wherein generating a number of the second parity symbols from the information includes generating the number of the second parity symbols from both the first parity symbols and the information.

<sup>12</sup>  
<sup>10</sup>  
~~25~~. (Original) The method of claim ~~23~~, wherein recovering the information from the encoded data block using the first parity symbols includes detecting or correcting errors in the information which can be detected or corrected using the first parity symbols.

<sup>13</sup>  
<sup>10</sup>  
~~26~~. (Currently Amended) The method of claim ~~23~~, wherein recovering the information from the encoded data block using the second parity symbols includes detecting or correcting errors in the information which can be detected or corrected using the second parity symbols.
